Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical agents.

N-PSDB; AAA30759.

Example 1; Page 308-309; 341pp; English.

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 and AAA30775-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (ICS) and transmembrane domain 6 (TM6). A non-endogenous mainto acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acid N-terminal of an endogenous proline in TM6 to form a sequence X-AAA15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15

amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. The present sequence represents a human wild-type GPCR referred to in an exemplification of the invention 8\$6666666666668

```
The invention relates to screening a test compound to determine whether the compound is a GPR40 receptor (G protein-coupled receptor) ligand comprises detecteding whether the test compound competitively inhibits the binding of a fatty acid GPR40 ligand to a GPR40 receptor. Also included are (1) a method of screening a compound for GPR40 antagonist activity, comparising: (a) measuring any detectable signal produced by a reporter gene (comprising: (a) measuring any detectable signal produced by a reporter gene (comprising in the presence of both test compound and agonist; or (c) detecting whether the compound decreases glucose-stimulated insulin release from mammalian parcreatic beta cells in the presence of a GPR40 agonist; comparison of the GPR40 agonist; (2) a method of screening a compound for GPR40 agonist; (2) a method of screening a compound for GPR40 agonist activity, which comprises: (a) detecting any compound for GPR40 agonist activity, which comprises: (a) detecting any compound for GPR40 agonist activity, which comprises: (a) detecting any compound for GPR40 agonist compounds for treating disorders e.g. type 2 diabetes, obesity, glucose-stimulated insulin release from mammalian character, obesity, glucose or insulin intolerance, neurodegenerative compuence compounds for treating disorders e.g. type 2 diabetes, obesity, glucose or insulin intolerance, neurodegenerative compounds compounds for treating disorders e.g. type 2 represents human GPR40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 LKAVEALASGAWPLPASICPVFAVAHFFPLYAGGGFLAALSAGRYLGAAFPLGYQAFRRP 120

New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.

Disclosure; Fig 1; 523pp; English.

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino caids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polyapptide in a sample; and (2) an isolated antibody having high specificity and high affinity or andidate particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for captening immune-related diseases, e.g. AlDS, Alabaimer's disease, call reaging immune-related disease, e.g. AlDS, Alabaimer's disease, atherosclerosis, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, varial infections and acute disease, parkinson's disease, multiple sclerosis, pain, psoriasis, canxety, depression, schizophrenia, dementia, memory consession, phypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or sepilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or used in immunoassays and immunodiagnosis. ABZ42253 to ABZ42869 encode GPCR proteins given in ABPB1675 to ABBP2018, which are used in the present invention

WPI; 2003-671661/63. N-PSDB; ADB61403. Fatty acid and elcosanoid-binding G-protein coupled receptor protein GPR40 for control of pancreatic function and treatment of diabetes.

Claim 34; Page 235-236; 257pp; Japanese.

The invention relates to a novel screening method comprising a fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse. Tat, crab-eating workey and hamster (sequences fully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and thehr compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarterioscherotic, antiarthritic, osteopathic, thrombolyric, noctropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, diabetic retinopathy, diabetic retinopathy, diabetic retinopathy, diabetic retinopathy, hyporlipaemia, skin diseases, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hypoglycaemia, edema, insulin cresistance, insulin allergy, fat metabolism disorders and cancer. This sequence represents a human GPR40 protein of the invention.

ö
version of an endogenous human GPCR that comprises a transmembrane 6 region and an intracellular loop 3 region. The altered human GPCR polypeptides are useful for screening test compounds for identification of inverse agonists or partial agonists of GPCR polypeptides, which may have therapeutic uses. The altered GPCRs may also be used in vivo or in vitro in biological research. A nucleic acid encoding the altered GPCR may be used to create a transgenic animal expressing the altered GPCR. The method allows screening for compounds that modulate the activity of a human G protein-coupled receptor without the need for provision of a ligand for the receptor. This is particularly useful in allowing screening of compounds against orphan receptors for which no ligand is currently known. This sequence represents a human GPCR polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The invention branch to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GCRS, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743) and AAA30775-A30779). The mutant proteins of the invention contain a mutation in a portion of the proteins of the invention contain a mutation in a portion of the proteins of the invention contain a mutation in a portion of the proteins of the invention contain a contain a mutation in a portion of the invention of the invention of amino acid stretched for an endogenous residue in TM6 to form a sequence X-CC (AA)15-Pro. The endogenous amino acid is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous cresidues. The one-integration of partial agonists for use as pharmaceutical conditions. The mutant proteins are also useful for treating for a elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. Sequences AAY90643-CC AAY90677 and AAY90663-Y90687 the mutant human GPCRs of the invention
                                                                                                                                                                                    The invention relates to constitutively active, non-endogenous versions
Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                           Example 2; Page 325-326; 341pp; English.

```
The invention relates to a method for treating a non-endogenous, constitutively active version of an endogenous human G protein-coupled receptor (GPCR) that has a transmembrane-6 (TMG) region and an intracellular-3 (IC3) region, by substituting a specific amino acid in intracellular-3 (IC3) region, by substituting a specific amino acid in the TMG region with a different amino acid, and testing for constitutive activity. The method is useful for creating a constitutively active version of an endogenous human GPCR that comprises a transmembrane 6 region and an intracellular loop 3 region. The altered human GPCR colypeptides are useful for screening test compounds for identification of inverse agonists or partial agonists of GPCR polypeptides, which may have therapeutic uses. The altered GPCRs may also be used in vivo or in viro in biological research. A nucleic acid encoding the altered GPCR may be used to create a transgenic animal expressing the altered GPCR conversed and allows screening for compounds that modulate the activity of a ligand for the receptor. This is particularly useful in allowing corrections of a correction of a ligand for compounds against orphan receptors for which no ligand is currently known. This sequence represents a human GPCR polypeptide of the
                                                                                                                                                                                                                                                                                                                          Creating a constitutively active version of an endogenous human G protein coupled receptor (GPCR) comprises substituting a specific amino acid in the transmembrane-6 region with a different amino acid, and testing for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

Fatty acid and eicosanoid-binding G-protein coupled receptor protein GPR40 for control of pancreatic function and treatment of diabetes.

Claim 1; Page 240-241; 257pp; Japanese.

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamster (sequences fully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel farty acid and GPR40 protein and their compositions have the collowing activities: antidiabetic, anabolic, neuroprotective, ephrotropic, ophthalmological, antilipaemic, dermatological, nethrotropic, antiatrhitic, osteopathic, thrombolytic, notropic, antiatrhitic, osteopathic, thrombolytic, notropic, ancestic, hypotensive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and further compositions can be used in the treatment, prevention and funganosis of diabetics retinopathy, hyperlipaemia, skin diseases, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, resistance, insulin allergy, fat metabolism disorders and cancer. This sequence represents a monkey GFR40 protein of the invention.

Andrews JL, Briscoe CP,

Identifying GPR40 receptor ligand for treating disorders e.g. obesity, comprises detecting whether the test compound competitively inhibits the binding of a fatty acid GPR40 ligand to a GPR40 receptor.

Disclosure; Page 51; 53pp; English.

The invention relates to screening a test compound to determine whether the compound is a GPR40 receptor (G protein-coupled receptor) ligand computies detecting whether the test compound competitively inhibits the binding of a fatty acid GPR40 ligand to a GPR40 receptor. Also included are (1) a method of screening a compound for GPR40 antagonist activity, comprishing; (a) measuring any detectable signal produced by a reporter gene (comprishing a reporter gene under the control of G protein GG responsive transcriptional element); (b) detecting a decrease in reporter gene expression in the presence of both test compound and agonist; or (c) detecting whether the compound decreases glucose-stimulated insulin clease from mammalian pancreatic beta cells in the presence of a GPR40 agonist, compared to glucose-stimulated insulin release that would occur agonist, compared to glucose-stimulated insulin release that would occur agonist, compared to glucose-stimulated insulin release that would occur compound for GPR40 agonist activity, which comprises: (a) detecting any reporter gene expression; or (b) detecting whether the compound binds to GPR40 and increases glucose-stimulated insulin release from mammalian pancreatic beta cells. The method is useful for identifying GPR40 antagonist or agonist compounds for treating disorders e.g. type 2

Fatty acid and eicosanoid-binding G-protein coupled receptor protein

```
The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamster (sequences think) defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarthritic, osteopathic, thrombolytic, nootropic, anorectic, hypotensive, and cytostatic. The movel fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic nephropathy, diabetic retinopathy, hyperlipaemia, skin diseases, compositions can be used in the treatment, prevention and diagnosis of diabetes retinopathy, hyperlipaemia, skin diseases, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hypoglycaemia, edema, insulin allergy, fat metabolism disorders and cancer. This sequence represents a mouse GPR40 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamater (sequences cully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the collowing activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antidiabetic, anabolic, dermatological, antiatrerioeclerotic, antiatrhitic, osteopathic, thrombolytic, notropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and functions can be used in the treatment, prevention and funganosis of diabeters, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyperlipaemia, skin diseases, arthitis, bone diseases, arteriosclerosis, thrombosis, hypertension, arthitis, bone diseases, arteriosclerosis, thrombosis, hypertension, resistance, insulin allergy, fat metabolism disorders and cancer. This sequence represents a rat GPR40 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MDLPPQLSFGLYVAAFALGFPLNVLAIRGATAHARLRLTPSLVYALNLGCSDLLLTVSLP

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, coriginating in mouse, rat, crab-eating monkey and hamster (sequences tully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and thehri compositions have the following activities: antidiabetic, anabolic, neuroprotective, compuroropic, ophthalmological, antilipaemic, dermatological, antiarterisoclerotic, antiarthritic, osteopathic, thrombolytic, noctropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and citater compositions can be used in the treatment, prevention and diagnosis of diabetic retinopathy, hyperlipaemia, skin diseases, compuropathy, diabetic retinopathy, hyperlipaemia, skin diseases, continitis, bone diseases, arteriosclerosis, thrombools, hypertension, indigestion, memory loss, obesity, hyposlycaemia, edema, insulin allersy, fat metabolism disorders and cancer. This creatstance, insulin allersy, fat metabolism disorders and cancer. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 LKAVEALASGAMPLPASLCPVFAVAHFFPLYAGGGFLAALSAGRYLGAAFPLGYQAFRRP 120

```

The present sequence is that of human G-protein coupled receptor 42 (GPR 42). The invention is based on the finding that expression of GPR 42 and

```
ä
GPR 41 (see AAB82758) is restricted to adipose tissue. GPR 41 or GPR 42 may therefore be used as a screening target for the identification and development of novel pharmaceutical agents for use in inhibiting 11pplysis. Methods are claimed for identifying agents that modulate GPR 41 or GPR 42 activity, involving: (1) contacting a test agent with GPR 41 or GPR 42 or a variant polypeptide capable of coupling to a G-protein, or GPR 42 or a variant polypeptide capable of coupling to a G-protein, thereby determining whether the test agent modulates activity. Such agents, which may be an activator of GPR 41 or GPR 42, an inhibitor of 1holysis, or a polynucleotide encoding GPR 41, GPR 42 or variant polypeptide, are useful for the treatment of dyslipidaemia, coronary heart disease, attended encoding GPR 41, angina, chronic metabolic syndrome (syndrome X) (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 DLLLLLELPRRWVEAANGMHWPLPFILCPLSGFIPFTTIYLTALFLAAVSIERFLSVAHP 120

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY906677 and AAY90677). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous cresidues. The constitutively actival agonists for use as pharmaceutical agenists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for clucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCRs are useful for treating diseases and diseases and diseases associated with that receptors. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. The present sequence represents a human wild-type GPCR referred to in an exemplification of
Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                             Example 1; Page 310-311; 341pp; English,

Identification of an agent for the modulation of G-protein coupled receptor useful for the treatment of disease i.e. dyslipidemia or stoke.

```
The present sequence is that of human G-protein coupled receptor 41 (GPR 41). The invention is based on the finding that expression of GPR 41 and GPR 42 (see AAB82759) is restricted to adipose tissue. GPR 41 or GPR 42 may therefore be used as a screening target for the identification and development of novel pharmaceutical agents for use in inhibiting closed are claimed for identifying agents that modulate GPR 11polysis. Methods are claimed for identifying agents that modulate GPR 41 or GPR 42 or a variant polypeptide capable of coupling to a G-protein; or GPR 42 or a variant polypeptide capable of coupling to a G-protein; and (2) monitoring for GPR 41 or GPR 42 activity in the presence of a G-protein, thereby determining whether the test agent modulates activity. Such agents, which may be an activator of GPR 41, GPR 42, an inhibitor of lipolysis, or a polynucleotide encoding GPR 41, GPR 42 or variant polypeptide, are useful for the treatment of dysliphdaemar, coronary heart disease, atheroselerosis, thrombosis or obesity, angina, chronic renal failure, peripheral vascular disease, stroke, type II diabetes or metabolic syndrome (syndrome X) (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DILLTVSLPLKAVEALASGAMPLPASLCPVFAVAHFFPLYAGGGFLAALSAGRYLGAAFP 111

JC5714
G protein-coupled receptor 40 - human
C;Species: Homo sapiens (man)
C;Date: 03-Dec-1997 #sequence revision 23-Jan-1998 #text change 21-Jul-2000
C, Accession: JC5714
R;Sawzdargo, M.; George, S.R.; Nguyen, T.; Xu, S.; Kolakowski Jr., L.F.; O'Dowd, B.F.
Biochem. Biophys. Res. Commun. 239, 543-547, 1997
A; Title: A cluster of four novel human G protein-coupled receptor genes occurring in clos
A; Reference number: JC5714; MUID: 98008875; PMID: 9344866
A;Accession: JC5714
A;Status: nucleic acid sequence not shown
A; Molecule type: mRNA
A;Residues: 1-300 <saw></saw>
A; Cross-references: GB: AF024687; NID: 92612945; PIDN: AAB86710.1; PID: 92612946
C;Superfamily: G protein-coupled receptor 43
C;Keywords: glycoprotein; lipoprotein; thiolester bond
F;13-32/Domain: transmembrane #status predicted <tm1></tm1>

F;43-64/Domain: transmembrane #status predicted <TM2>
F;83-104/Domain: transmembrane #status predicted <TM3>
F;125-144/Domain: transmembrane #status predicted <TM4>
F;184-206/Domain: transmembrane #status predicted <TM4>
F;184-206/Domain: transmembrane #status predicted <TM5>
F;222-243/Domain: transmembrane #status predicted <TM6>
F;252-260/Domain: transmembrane #status predicted <TM6>
F;255-260/Domain: transmembrane #status predicted <TM6>
F;255,165/Binding site: carbohydrate (Asn) (covalent) #status predicted F;289/Binding site: palmitate (Cys) (covalent) #status predicted
